Wood-Mizer® Sawmill

Safety, Setup, Operation & Maintenance Manual

1996 LT25

rev. B7.00 - C1.01

Safety is our #1 concern! Read and understand all safety information and instructions before operating, setting up or maintaining this machine.

September 1996

Form #684

This manual is to replace or to be used with all previous information received on the Wood-Mizer®* sawmill. All future mailings will be an addition to or a revision of individual sections of this manual as we obtain new information.

The information and instructions given in this manual do not amend or extend the limited warranties for the equipment given at the time of purchase.

If You Need To Order Parts...

From the continental U.S., call our toll-free Parts hotline at *1-800-525-8100*. Please have the vehicle identification number and your customer number ready when you call. Wood-Mizer will accept these methods of payment:

- Visa, Mastercard, or Select Purchase
- COD
- Prepayment
- Net 15 (with approved credit)

Be aware that shipping and handling charges may apply. Handling charges are based on size and quantity of order. In most cases, items will ship on the day they are ordered. Second Day and Next Day shipping are available at additional cost.

If your sawmill was purchased outside of the United States, contact your distributor for replacement parts.

If You Need Service ...

From the continental U.S., call us toll-free at *1-800-525-8100*. Ask to speak with a Customer Service Representative. Please have your vehicle identification number and your customer number ready when you call. The Service Representative can help you with questions about alignment of your mill, blade sharpening, or cutting a particular species of wood. He also can schedule you for a service call.

Office Hours:

All times are Eastern Standard Time. Please remember that Indiana does not go on Daylight Savings Time in the summer.

Monday - Friday 8 a.m. to 5 p.m.

Saturday 8 a.m. to 12 p.m.

If your sawmill was purchased outside the United States, contact the distributor for service.

IMPORTANT! Read the entire Operator's Manual before operating the sawmill. Take notice of all safety warnings throughout this manual and those posted on the machine. Keep this manual with this machine at all times, regardless of ownership.

*Wood-Mizer® is a registered trademark of Wood-Mizer Products, Inc.

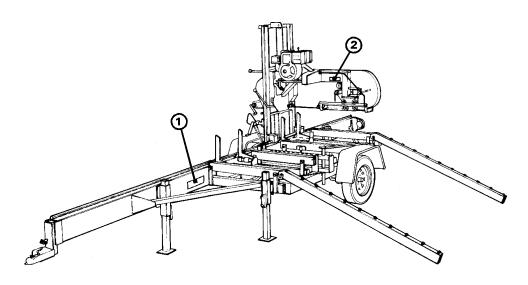

Your Vehicle Identification Number And Customer Number

Each Wood-Mizer sawmill has a 17-digit Vehicle Identification Number (VIN). see the figure at the right for VIN locations. See the chart at the right for VIN description.

Each sawmill is also identified with a model number which includes the base model and the engine/motor configuration. An 's' after the model number indicates the model is approved for sale in countries that have adopted German "Gerprüfte Sicherheit: (G.S.) safety standards. The model number is located on the middle blade housing cover. See the figure at the right for a description of the model number.

When you pick up your mill, you will receive a customer number. Both the VIN and your customer number expedite our service to you. Please write these numbers below so you have quick, easy access to them.

VIN:	
Customer No:	
Model No:	

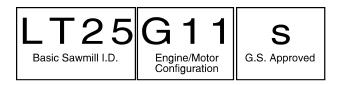

VEHICLE IDENTIFICATION NUMBER LOCATIONS.

V.I.N. DESCRIPTION.

NOTE: Sawmills manufactured before January, 1997 do not have the repeated revision level or the minor revision level.

SECTION 1 SAFETY & GENERAL INFORMATION

This symbol calls your attention to instructions concerning your personal safety. Be sure to observe and follow these instructions. This symbol accompanies a signal word. The word **DANGER** refers to hazards that can cause death or serious, irreversible personal injury. The word **WARNING** suggests a safety hazard that can cause personal injury. **CAUTION** refers to hazards that can cause damage to the equipment or property only.

Read all safety instructions before operating this equipment and observe all safety warnings!

Safety instructions are listed in this section by the following operations:

- Blade Handling
- Sawmill Setup
- Sawmill Operation

1.1 Blade Handling

WARNING! Always wear gloves and eye protection when handling bandsaw blades. Keep all persons away from area when coiling or carrying a blade.

1.2 Sawmill Setup

WARNING! Put front outrigger down before moving cutting head from the rest position. Failure to do so may result in serious injury.

WARNING! Do not set up the mill on ground with more than a 10 degree incline. If setup on an incline is necessary, put blocks under one side of the mill or dig out areas for outrigger legs to keep mill level. Setting up the mill on an incline could cause it to tip over, resulting in serious personal injury.

WARNING! Chock the trailer wheels to prevent movement before unhitching it from the towing vehicle. Failure to do so may result in serious injury or death.

WARNING! Always make sure the trailer is supporting the sawmill frame when operating a sawmill with adjustable outriggers. Failure to do so may result in serious injury or death. The adjustable outriggers are intended to support the saw frame with assistance from the trailer.

WARNING! The adjustable outriggers supplied with portable sawmills are not intended for setup on concrete or other hard surfaces. Long-term use of the adjustable outriggers on hard surfaces may cause the outriggers to fail, causing the sawmill to drop. This could result in possible serious injury or death.

If setting the sawmill up on concrete or other hard surface, replace the adjustable outrgger legs with stationary legs.

1.3 Sawmill Operation

DANGER! Never operate or tow the sawmill without all guards and covers in place and secured.

Be sure the blade housing and pulley covers are in place and secure. Use the safety retainer pin and cable to fasten blade housing covers.

DANGER! Always disengage the clutch/brake mechanism whenever the sawmill is not cutting.

DANGER! Always keep hands away from moving bandsaw blade.

DANGER! Keep all persons a safe distance away from work area when operating sawmill or loading and turning logs.

DANGER! Be sure the power feed switch is in the neutral position before turning the key switch to the ON or ACC position. This prevents unwanted carriage movement.

DANGER! Check to be sure the saw head is resting firmly on the rest pin and mast rail stops and that the safety chain is secured before towing the sawmill.

WARNING! Always secure the cutting head with a 5/16" chain before adjusting the up/down chain. The cutting head may fall, causing severe injury or death.

WARNING! Always wear eye, ear, respiration, and foot protection when operating the sawmill.

WARNING! Secure all loose clothing and jewelry before operating the sawmill.

WARNING! Always make sure log is clamped securely before sawing.

CAUTION! Always be sure that all safety warning decals are clean and readable. Replace all damaged warning decals. Contact your local distributor, or call your Customer Service Representative to order more decals.

Safety & General Information Sawmill Operation

CAUTION! Be sure the pivot rails, turning arm, clamp, and toe boards are out of the way before loading a log onto the bed. Also, be sure the cutting head is moved far enough forward so the log does not hit it.

CAUTION! It is important that the lower stop bolts are properly adjusted to secure the carriage on the track rail. Failure to properly adjust the stop bolts can cause saw head damage, especially during mill transportation.

CAUTION! Do not use the blade guide arm knob to move the carriage head forward and backward. Damage to the blade guide arm may result.

IMPORTANT! It is always the owner's responsibility to comply with all applicable federal, state and local laws, rules and regulations regarding the ownership, operation and towing of your Wood-Mizer sawmill. All Wood-Mizer mill owners are encouraged to become thoroughly familiar with these applicable laws and comply with them fully while using or towing the mill.

Always properly dispose of all sawing byproducts, including sawdust and other debris.

1.4 Belt Sizes

See Table 1-1. Belt sizes for the LT25 are shown.

Description	Belt Size	Wood-Mizer Part #
Engine Drive Belt (Rev. B7-B8)	BX68	P12139
Engine Drive Belt (Rev. B9)	BX73	014585
Engine Drive Belt (Rev. C1+)	BX72	P09555
Blade Pulley Belts	B57 ¹	P04185

TABLE 1-1

¹ To insure proper blade tracking, use Goodyear, Dayco Super II, or Browning belts only.

1.5 Blade Sizes

See Table 1-2. Wood-Mizer TRU•SHARP™ offers three types of blades to provide efficient sawing for all models of sawmills. The engine/motor size of your sawmill and the type of wood you saw should determine which blade you choose for optimum performance.

Gas/Diesel	Recommended Blade For Sawing:		
Engine Size	Softwood	Hardwood	Frozen or Hard-to-Cut Wood
5 hp - 14hp	.042 x 7/8 x 1 1/4"	.035 x 7/8 x 1 1/4"	.045 x 7/8 x 1 1/4" F ¹
16hp or more	.045 x 7/8 x 1 1/2"	.042 x 7/8 x 1 1/4" .045 x 7/8 x 1 1/2" ²	.045 x 7/8" x 1 1/4" F ¹
Electric Motor	.045 x 7/8 x 1 1/2"	.042 x 7/8 x 1 1/4" .045 x 7/8 x 1 1/2" ²	.045 x 7/8 x 1 1/4" F ¹

TABLE 1-2

See The Blade Handbook for blade hook angle, tooth height, and tooth set specifications.

¹ TRU•SHARP™ "F" blades use a 9/29 profile (9° hook angle and 29° back angle) and are designed to cut frozen and/or extremely dense, hard-to-cut wood. Standard TRU•SHARP™ blades use a 10/30 profile.

² Customer may choose preferred blade.

1.6 Cutting Capacity

See Table 1-3. The log size capacities of the LT25 and LT25L sawmills are listed below.

	Max. Diameter ¹	Max. Length ¹
LT25	32" (81 cm)	16'8" (5.1 m)
LT25L	32" (81 cm)	21' (6.4 m)

TABLE 1-3

See Table 1-4. The performance capacity of the LT25 and LT25L sawmills is listed below. Peak cutting rates are measured in 12" (30 cm) wide red oak and represent the capability of the sawmill only. Rates based on using Tru-Sharp 1 1/4" x .042 blades.

Model	Cutting Rate	
LT25/LT25L	12 ft./min. (3.6 m/min.)	

TABLE 1-4

¹ Maximum log capacity for a basic mill is 4400 lbs. (1996 Kg).

1.7 Engine/Motor Specifications

The standard engine is an 11HP Briggs and Stratton model number 256422, type 0015.

1.8 Overall Dimensions

See Table 1-5. The overall dimensions of the LT25 and LT25L sawmills are listed below.

Model	Length	Width	Height	Weight
LT25	19' 11" (5.3 m)	6' 2 1/2" (1.9 m)	7' 6" (2.3 m)	1600 lbs. (726 Kg)
LT25 w/Trailer	21' 9" (6.6 m)	6' 5" (2.0 m)	7' 6" (2.3 m)	1947 lbs. (883 Kg)
LT25L	24' 4" (7.4 m)	6' 2 1/2" (1.9 m)	7' 6" (2.3 m)	1680 lbs. (762 Kg)
LT25L w/Trailer	26' 2" (8.0 m)	6' 5" (2.0 m)	7' 6" (2.3 m)	2027 lbs. (919 Kg)

TABLE 1-5

1.9 Components

See Figure 1-1. The major components of the Wood-Mizer LT25 and LT25L are shown below.

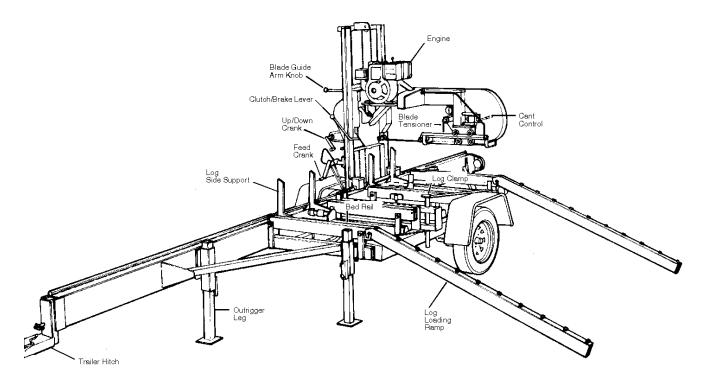

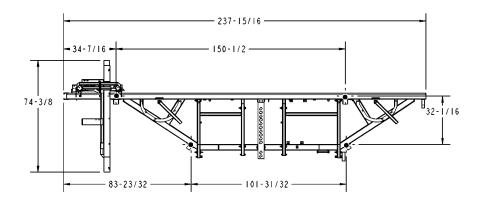

FIG. 1-1

Safety & General Information Components

SECTION 2 SETUP & OPERATION

2.1 Stationary Sawmill Setup

See Figure 2-1. Set up the mill on firm footing. Level by eye. Fasten the mill to the floor to prevent any creep after prolonged use.

LT25 Stationary Sawmill

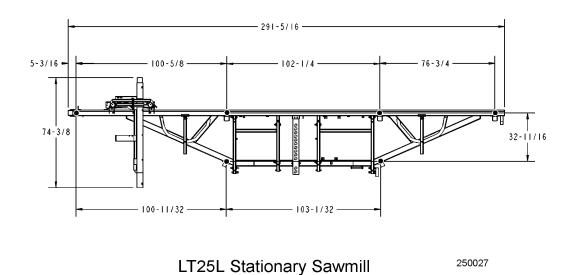

FIG. 2-1

NOTE: Make sure the unit is level before securing. It IS possible to twist the mill frame by jacking one foot higher than the others.

Setup & Operation 2596doc091809 2-1

DANGER! Do not operate a stationary sawmill without the feet securely fastened to the floor. If the feet are not securely fastened, loading and turning large logs could cause the sawmill to tip over.

- 1. Unhook the carriage safety chain, located at the bottom of the vertical mast.
- 2. Use the up/down crankswitch on the control panel to raise the cutting head from the carriage rest pin. Swing the rest pin down below bed level.
- 1. Use the feed handle to move the cutting head toward the front end of the mill.
- 2. Raise the two side supports that will prevent a log from falling off the side of the mill when loaded.

See Figure 2-2.

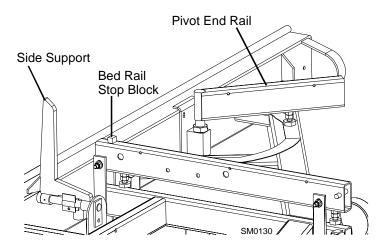

FIG. 2-2

2.2 Portable Sawmill Setup

WARNING! Do not set up the mill on ground with more than a 10 degree incline. If setup on an incline is necessary, put blocks under one side of the mill or dig out areas for outrigger legs to keep mill level. Setting up the mill on an incline could cause it to tip over, resulting in serious personal injury.

WARNING! Chock the trailer wheels to prevent movement before unhitching it from the towing vehicle. Failure to do so may result in serious injury or death.

WARNING! Always make sure the trailer is supporting the sawmill frame when operating a sawmill with adjustable outriggers. Failure to do so may result in serious injury or death. The adjustable outriggers are intended to support the saw frame with assistance from the trailer.

WARNING! The adjustable outriggers supplied with portable sawmills are not intended for setup on concrete or other hard surfaces. Long-term use of the adjustable outriggers on hard surfaces may cause the outriggers to fail, causing the sawmill to drop. This could result in possible serious injury or death.

If setting the sawmill up on concrete or other hard surface, replace the adjustable outrgger legs with stationary legs.

1. Unhitch the mill from the vehicle.

See Figure 2-3.

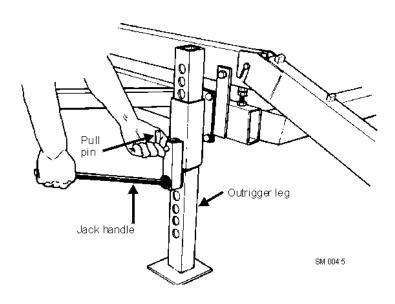

FIG. 2-3

2. Lower and set the front three outriggers. Lift the weight from the locking pin using the jack handle. Pull the locking pin to release the outrigger and lower the outrigger as necessary. Secure with the locking pin.

WARNING! Put front outrigger down before moving cutting head from the rest position. Failure to do so may result in serious injury.

For Fine Adjust Outriggers (FAOs), lower the outrigger as close to the ground as possible, then secure in place with the locking pin. Adjust the outrigger base so that it contacts the ground. To adjust, use the provided wrench to turn the height adjustment nut. Turn clockwise to lower. Turn counterclockwise to raise. Maximum adjustment available is 1 1/2" (3.8 cm).

CAUTION! Do not adjust the FAO outrigger base height while there is weight on the FAO. Damage to the FAO may result.

2-4 2596doc091809 Setup & Operation

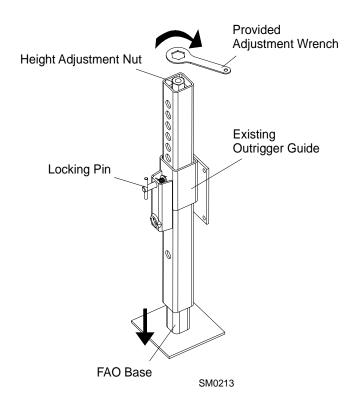

FIG. 2-3. BASE HEIGHT ADJUSTMENT (FOR FINE ADJUST OUTRIGGER ONLY).

- **3.** Unhook the carriage safety chain.
- 4. Turn the key switch on the control panel to the ACC position to enable the battery-operated accessories. Use the up/down switch on the control panel to raise the cutting head from the carriage rest pin. Remove the locking pin and swing the rest pin down below bed level.
 - **5.** Use the feed handle to move the cutting head toward the front end of the mill. Lower and set the remaining rear outriggers.
 - **6.** Level the sawmill by adjusting the outriggers to raise or lower each end of the sawmill. Adjust all outriggers evenly to avoid twisting the mill frame by jacking one outrigger higher than the others.

For FAO(s), fine tune the outrigger base height as necessary. Move the cutting head to the opposite end of the mill from the outrigger. Raise the entire outrigger (to remove the sawmill weight from it) and adjust the outrigger base as necessary. Lower the entire outrigger and use the locking pin to secure in position.

CAUTION! Do not adjust the FAO outrigger base height while there is weight on the FAO. Damage to the FAO may result.

7. Remove the fenders by lifting them out of the slots.

CAUTION! To prevent fender damage, remove fenders before operating sawmill or loading logs.

8. Raise the two side supports that will prevent a log from falling off the side of the mill when loaded.

See Figure 2-4.

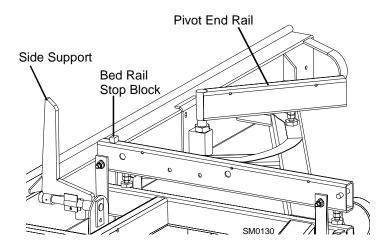

FIG. 2-4

2.3 Replacing The Blade

WARNING! Always wear gloves and eye protection whenever handling bandsaw blades. Changing blades is safest when done by one person! Keep all other persons away from work area when changing blades. Do not change the blade with the engine running.

See Figure 2-5. Remove the blade housing cover(s) that are over the drive wheels. Turn the tension handle to release the blade tension until the wheel is pulled in and the blade is lying loose in the blade housing. Lift the blade out of the blade housing.

When installing a blade, make sure the teeth are pointing the correct direction. The teeth should be pointing toward the operator side of the mill when you are looking at the blade below the blade guides. Install the blade so it is lying around the wheels.

Position 1 1/4" wide blades on the wheels so the gullet is 1/8" (3.0 mm) out from the edge of the wheel. Position 1 1/2" wide blades on the wheels so the gullet is 3/16" (4.5 mm) out from the edge of the wheel.

Close the middle blade housing cover.

Next, turn the tension handle until the blade is tensioned correctly.

2.4 Tensioning The Blade

See Figure 2-5. Tension the blade by turning the hydraulic tensioning handle clockwise until the tension gauge indicates the recommended tension.

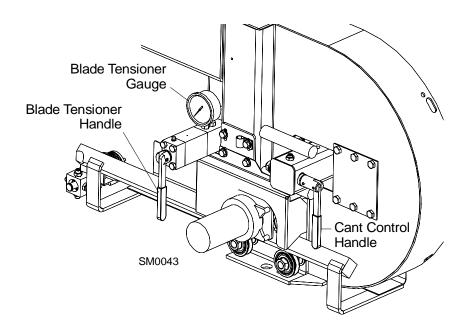

FIG. 2-5

See Table 2-1. The recommended tensions for different blades is shown below.

Blade Type	Acceptable Range	Ideal Tension
.035" x 7/8" x 1 1/4"	1800 - 2100 psi	2000 psi
.042" x 7/8" x 1 1/4"	2100 - 2400 psi	2300 psi
.045" x 7/8" x 1 1/2"	2100 - 2400 psi	2300 psi

TABLE 2-1

The tension gauge should be checked occasionally when adjusting the cant control or while cutting. Ambient temperature changes will cause tension to change. Adjust the tension handle as necessary to maintain the recommended tension level.

CAUTION! The blade tension should be released when the mill is not in use. Changes in temperature could cause increased pressure in the tensioner and loss of fluid from the gauge.

2-8 2596doc091809 Setup & Operation

2.5 Tracking The Blade

Make sure the middle blade housing cover is closed and all persons are clear of the open side of the saw head.

Start the engine. Pull lightly on the clutch handle, rotating the blade until the blade positions itself on the wheels.

See Figure 2-6. Position 1 1/4" wide blades so the gullet is 1/8" (3.0 mm) out from the edge of the blade wheel ($\pm 1/32$ [.75 mm]). Position 1 1/2" blades so the gullet is 3/16" (4.5 mm) out from the edge of the blade wheel ($\pm 1/32$ [.75 mm]).

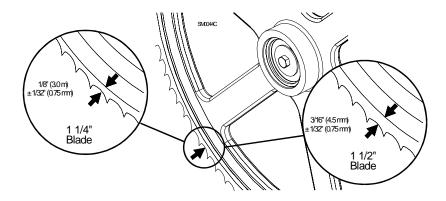

FIG. 2-6

To adjust where the blade travels on the blade wheels, use the cant control handle shown in **Figure 2-5.**

Note: The cant control handle is secured with a spring to prevent it from interfering with the blade guide arm. Remove the handle from behind the spring and return after adjustment is complete.

If the blade is too far out, back the blade onto the wheel by turning the cant control counterclockwise. If the blade is too far in, turn the cant control clockwise until the gullet of the blade is the correct distance from the front edge of the wheel.

Retension the blade to the recommended tension to compensate for any adjustments you have made in the cant control. Replace the covers.

DANGER! Never operate the sawmill without all guards and covers in place and secured.

Be sure the blade housing and pulley covers are in place and secure. Use the safety retainer pin and cable to fasten blade housing covers.

IMPORTANT! After aligning the blade on the wheels, always double-check the blade guide spacing and location. (See Section 5 for more information.)

2.6 Starting The Engine

See the appropriate manual supplied with your specific engine/motor configuration for starting and operating instructions.

DANGER! Read the entire manual before operating your Wood-Mizer sawmill.

DANGER! Never operate the sawmill without all guards and covers in place and secured.

Be sure the blade housing and pulley covers are in place and secure. Use the safety retainer pin and cable to fasten blade housing covers.

DANGER! Do not start the engine or motor when the clutch/brake lever is in the engaged (down) position. Always be sure the blade is disengaged and all persons are away from the blade before starting the engine.

WARNING! Always wear eye, ear, and respiration protection when operating this equipment.

2.7 Loading, Turning, And Clamping Logs

CAUTION! Be sure the pivot end rails, turning arm, clamp, and toe boards are out of the way before loading a log onto the bed. Be sure logs are positioned on the bed so that they will not damage the manual winch when loaded. Also, be sure the cutting head is moved far enough forward so the log does not hit it.

To Load Logs

- 1. Place the loading ramps on the two bed rails that will support the length of the log. **NOTE:** The loading ramps cannot be fastened securely to the bed rail located directly above the tire. Do not use this rail.
- **2.** Position the log at the foot of the ramps.
- **3.** Remove the winch cable from the log turner (if applicable) and route the cable over the top of the log. Wrap the cable around and underneath the log. Hook the cable to the third hole in the log clamp bracket. See *Winch Operation Manual*.

DANGER! Keep all persons out of the path of moving equipment and logs when operating sawmill or loading and turning logs. Failure to do so will result in serious injury.

- **4.** Crank the winch to begin rolling the log up the ramps and onto the sawmill bed. Keep the log centered on the ramps as it rolls up.
- **5.** Once the log is on the sawmill bed, place the log clamp in the clamp bracket. This will stop the log from rolling back off the side of the mill when you remove the winch cable.

NOTE: Logs also may be loaded onto the mill with a tractor or other equipment specifically designed for that purpose.

2-12 2596doc091809 Setup & Operation

To Turn Logs

- **1.** Use cant hooks or the optional log turner to rotate the log on the sawmill bed. See *Log Turner Manual*.
- **2.** Spin the log against the side supports until it is turned the way you want it for the first cut. If you want to turn the log more, do the following steps.
- **3.** Clamp the log against the side supports.
- **4.** Lower the turner arm below the log.
- 5. Raise the turner arm to get a new bite on the log.
- **6.** Disengage the clamp.
- 7. The log can be turned now. Repeat steps 4 through 7 until the log is turned as desired.

To Clamp Logs

- 1. Position the log clamp in the bracket in the hole closest to the log.
- 2. Move the clamp down far enough so that it is below your first few cuts. Pivot the clamp so that it moves the log firmly against the side supports. Lock the clamp in position with the locking chain.

See Figure 2-7.

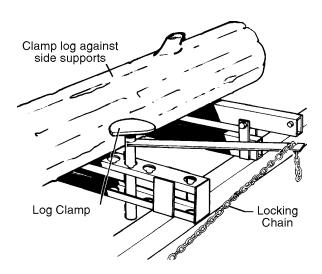

FIG. 2-7

- **3.** Make sure the side supports are positioned low enough for the blade to pass over them. If they are not, back the clamp off slightly and push the side supports down until they are positioned below the level of your first few cuts.
- **4.** Use the optional toe boards to level the log if desired. See the manual supplied with the manual toe boards for details concerning toe board operation.

2-14 2596doc091809 Setup & Operation

2.8 Up/Down Operation

- **1.** Install a blade, if needed, and check for correct blade tension. (See Section 2.4 Tensioning The Blade).
- 2. Set the cutting head to the desired height. (The blade height scale show the height of the blade above the bed rails.)

See Figure 2-8. Use the up/down crank to raise or lower the cutting head.

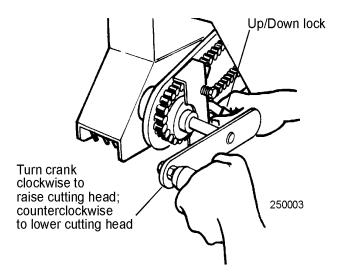

FIG. 2-8

- 3. To raise the cutting head, turn the up/down crank clockwise until the desired blade height is reached.
- **4.** To lower the cutting head, lift the up/down lock. Turn the up/down crank counterclockwise as desired. Lower the lock until it seats firmly between the teeth of the up/down sprocket.

CAUTION! DO NOT try to force the carriage above the 35" (88 cm) mark or below the 1" (2.54 cm) mark. Damage to the chain may result.

Setup & Operation 2596doc091809 2-15

2.9 Blade Guide Arm Operation

- 1. Look down the length of the log to see its maximum width. The outer blade guide should be adjusted to clear the widest section of the log by less than 1" (25.4 mm).
- 2. Use the blade guide arm knob to adjust the outer blade guide as necessary. Pull the blade guide arm knob out away from the mill to move the arm in. Push it in toward the mill to move the arm out.

See Figure 2-9.

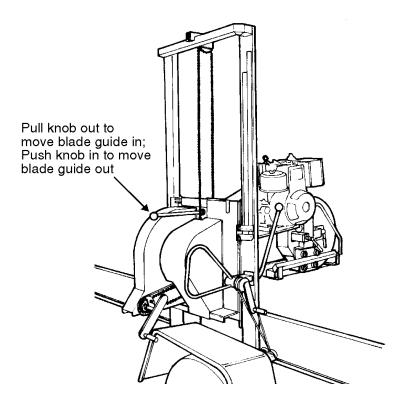

FIG. 2-9

2-16 2596doc091809 Setup & Operation

2.10 Clutch/Brake Operation

- 1. Clear any loose objects from the area of the blade, motor, and drive belt.
- **2.** Make sure the clamp and side supports are adjusted below the level of your first few cuts.
- 3. Start the engine or motor as instructed in the engine manual.

DANGER! Never operate the sawmill without all guards and covers in place and secured.

Be sure the blade housing and pulley covers are in place and secure before starting the engine or motor. Use the safety retainer pin and cable to fasten blade housing covers..

See Figure 2-10. The clutch/brake lever is located next to the engine.

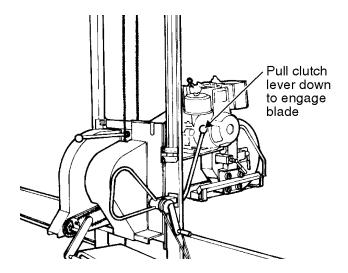

FIG. 2-10

4. To engage the blade, pull the lever down until it locks in the down position. This engages the drive mechanism, releases the blade brake, and increases the engine speed to full throttle.

To disengage the blade, raise the clutch/brake lever to the up position. This disengages the drive belt, engages the blade brake, and returns the engine to idle.

CAUTION! Failing to stop the blade can cause it to be pulled off by a wood sliver (while traveling in reverse). This will ruin the blade. Stopping the blade when returning the carriage also increases the life of the blade.

2.11 Feed Operation

The feed system includes a hand crank to move the carriage forward or backward. The speed at which the carriage travels forward depends on how fast you turn the feed crank.

The height of the feed crank is adjustable. There are two sets of mounting holes, one higher and one lower. To change the height of the feed crank, unbolt the crank assembly from the carriage and reinstall to the desired set of mounting holes.

See Figure 2-11.

1. To move the carriage forward, rotate the feed crank clockwise.

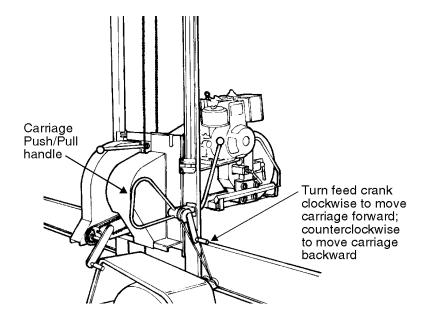

FIG. 2-11

HINT: To get a straight cut in the first part of the board, feed the blade into the log at a slow speed. This stops the blade from flexing and dipping up or down. Use a slow speed until the whole width of the blade has entered the cut. Then use increase the feed rate as desired. Maximum feed rate varies with width and hardness of the wood. Over-feeding results in engine and blade wear, and also produces a wavy cut.

2. To move the carriage backward, rotate the feed crank counterclockwise, or use the carriage push/pull handle. Always disengage the blade before returning the carriage and raise the carriage slightly to make sure the blade clears the log.

CAUTION! Do not pull or push the blade guide arm knob to move the saw head in either direction. Damage to the blade guide arm will result.

2-18 2596doc091809 Setup & Operation

3. Make sure that the blade does not catch on the end of the log. Raise the carriage slightly to make sure the blade clears the log when returned. HINT: Try to stop the blade while the heel of the blade is still on the log. Then bring the carriage back without adjusting the blade up. This lets you keep the blade at the current height setting so you can make the next blade height adjustment more quickly.

DANGER! Always keep away from the trailer axle to avoid being caught between the axle and moving saw carriage.

2.12 Cutting The Log

The following steps guide you through normal operation of the Wood-Mizer sawmill.

- 1. Once the log is placed where you want it and clamped firmly, position the blade close to the end of the log.
- 2. Determine where to make your first cut. The sight gauge and/or the blade height scale will help you to do this. See Section 2.14 Blade Height Sight Gauge and See Section 2.15 Blade Height Scale. Set the blade to the desired height with the up/down crank. Make sure that the blade will clear all side supports and the clamp. Adjust the outer blade guide to clear the widest section of the log by moving the blade guide arm knob.
- **3.** Make sure all covers and guards are in place. Start the engine. Engage the clutch/brake lever to start the blade spinning.
- **4.** Start the water lube option if necessary to prevent sap buildup on the blade. <u>See Section 2.16 Water Lube Operation</u>.
- 5. Feed the blade into the log slowly. <u>See Section 2.11 Feed Operation.</u> Once the blade completely enters the log, increase the feed rate as desired. Always try to cut at the fastest speed you can while keeping an accurate cut. Cutting too slowly will waste blade life and lower production!
- As you get to the end of the log, slow down the feed rate. When the teeth exit the end of the log, turn the feed rate all the way down and disengage the clutch/brake lever. Remove the slab that you have just cut from the log.
 - 7. Use the feed crank or the carriage push/pull handle to return the carriage to the front of the mill. Always disengage the blade before returning the carriage for the next cut.
 - **8.** Repeat until the first side of the log is cut as desired. Set aside the usable flitches (boards with bark on one or both sides). You can edge them on the mill later.
 - degrees. Make sure the flat on the log is placed flat against side supports if turned 90 degrees. Make sure it is placed on bed rails if turned 180 degrees. If the log was turned 90 degrees and you are using toe boards to compensate for taper in the log, raise the front or rear toe board again on the second side of the log until the heart is parallel with the bed.
 - **10.** Repeat the steps used to cut the first side of the log until the log is square. Cut boards from the remaining cant by adjusting the blade height for the thickness of boards that you want. **Example:** Remember that the blade cuts a 1/16 1/8" (1.6-3.2 mm) wide kerf. If you want 1" (25.4 mm) thick boards, lower the carriage 1 1/16 1 1/8" (27-28.6 mm) for each board.

2.13 Edging

The following steps guide you through edging boards on the Wood-Mizer sawmill.

- **1.** Raise the side supports to 1/2 the height of the flitches, or the boards that need to be edged.
- 2. Stack the flitches on edge against the side supports.
- 3. Clamp the flitches against the side supports halfway up the flitch height. (Wider flitches should be placed to the clamp side. When they are edged, flip them over to edge the second side without disturbing the other flitches or without having to pull them from the middle of the stack).
- **4.** Adjust the blade height to edge a few of the widest boards.
- 5. Loosen the clamp and turn the edged boards over to edge the other side.
- 6. Repeat steps 2-4.
- **7.** Loosen the clamp and remove the boards that have good clean edges on both sides. Clamp the remaining flitches and repeat steps 2-5.

2.14 Blade Height Sight Gauge

NOTE: Sight gauge supplied on LT25 through B7526LT30 through F4731 & LT40 through F5611LT30HD through F8522, LT40HD through F8458 & LT40HD Super through F8522 only.

See Figure 2-12. The sight gauge is provided on the cutting head carriage to help you decide where to make the first cuts on a log.

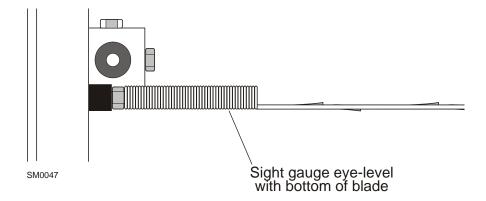

FIG. 2-12

Move the carriage forward until the blade is close to the end of the log.

Position yourself so that your eyes are level with the bottom of the sight gauge spring. With one eye closed, move your head up or down until the bottom of the sight gauge is lined up with the bottom of the blade.

Sight down the length of the log. You should be able to see where the blade will pass through the log down its entire length. Raise or lower the cutting head until you get the blade height you want.

HINT: After judging by eye where you want to make your first slab cut, check the scale. Move the up/down crank to fine-tune the blade height to an even measurement on the blade height scale.

Example: Adjust the blade up to 15" rather than cut at 14 13/16". This will make adjustments for the next cuts easier to figure on the scale.

2-22 2596doc091809 Setup & Operation

2.15 Blade Height Scale

See Figure 2-13. The blade height scale is attached to the carriage head frame. It includes:

- two blade height indicators
- an inch scale
- a quarter scale

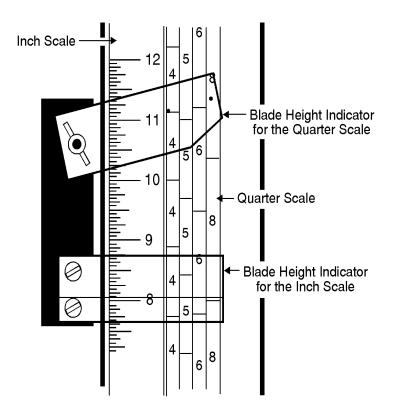

FIG. 2-13

The two indicators are plastic markers that move up and down with the cutting head. The lower indicator is used to read the inch scale, and the upper indicator is used to read the quarter scale.

The Inch Scale

The horizontal red line on the blade height indicator shows how many inches the bottom of the blade is above the bed of the mill. If you know the height of your blade at each cut, you can determine the thickness of lumber you are sawing.

Example: You want to cut 1" (25 mm) random width boards from a log. Position the blade for the first cut. Move the carriage to an even measurement on the inch scale. Make a trim cut. Return the carriage for the second cut and lower it 1 1/8" (29 mm) below the original measurement. (The extra 1/8" (3 mm) allows for saw kerf and shrinkage of the lumber.)

The scale is shaded. Yellow identifies areas where the blade could encounter a side support.

The Quarter Scale

See Table 2-2. The quarter scale has four sets of marks. Each set represents a specific lumber thickness. Saw kerf and shrinkage allowance are included, but actual board thickness will vary slightly depending on blade thickness and tooth set.

An optional Grade Hardwood Quarter Scale is also available. To choose which scale to use, determine what finished thickness you want to end up with. The Grade Hardwood Quarter Scale provides thicker finished boards usually required by commercial buyers. The Standard Quarter Scale allows for kerf and shrinkage of finished boards suitable for most custom applications. Always check with your customer before you saw to determine what actual finished thickness is required.

Sta	Standard Quarter Scale										
Scale	Actual Board Thickness										
4/4	1" (25 mm)										
5/4	1 1/4" (32 mm)										
6/4	1 1/2" (38 mm)										
8/4	2" (51 mm)										

Grade	Grade Hardwood Quarter Scale										
Scale	Actual Board Thickness										
4/4	1 1/8" (29 mm)										
5/4	1 3/8" (35 mm)										
6/4	1 5/8" (41 mm)										
8/4	2 1/8" (54 mm)										

TABLE 2-2

To use the quarter scale, look at the upper blade height indicator. It has two red dots. Loosen the wing nut and angle the indicator until one of the red dots is on the nearest mark of the desired lumber thickness scale.

When you return the carriage for a second cut, you can lower the carriage to the next mark on the lumber thickness scale you chose, without having to measure on the inch scale.

Example: You want to cut 1" (25 mm) (4/4) random width boards from a log. Position the blade for the first cut. Loosen the wing nut on the left end of the indicator. Move the indicator until one of the red dots is on the nearest 4/4 mark. Make a trim cut. Return the carriage for the second cut. Now, instead of having to measure down 1 1/8" (29 mm) on the inch scale, you can simply lower the blade so the indicator is aligned with the next 4/4 mark on the quarter scale. Turn the log 90 degrees and repeat.

2.16 Water Lube Operation

See Figure 2-14. The optional Water Lube System keeps the blade clean. Water flows from a 5-gallon (18.9 liter) bottle through a hose to the blade guide where the blade enters the log. A valve in the bottle cap controls the amount of water flow.

Not all types of wood require the use of the Water Lube System. When it is needed, use just enough water to keep the blade clean. This saves water, and lowers the risk of staining the boards with water. Usual flow will be 1-2 gallons (3.8-7.6 liters) per hour. A squirt of liquid dishwashing detergent in the water bottle will help clean the blade when cutting wood with a high sap content.

WARNING! Never use flammable fuels or liquids instead of water with this accessory. If these type of liquids are necessary to clean the blade, remove it and clean with a rag.

Before removing the blade, engage the clutch/brake lever. Let the blade spin with water running on it for about 15 seconds. This will clean the blade of sap buildup. Wipe the blade dry with a rag before storing or sharpening.

If you are sawing in freezing temperatures, remove the water lube bottle from the sawmill when done sawing and store it in a warm place. Blow any remaining water from the water lube hose.

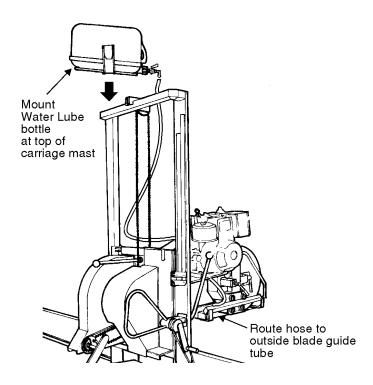

FIG. 2-14

2.17 Preparing The Sawmill For Towing

The Wood-Mizer trailer package makes transporting your sawmill easy and convenient. To get your sawmill ready for towing, follow these instructions.

- 1. Move the saw carriage to the front end of the sawmill. Raise the rear outriggers.
- 2. Move the carriage forward to the travel position over the rear bed rail.
- 3. Position the holes in the saw head over the travel rest pin.
- **4.** Lower the saw head until it is seated firmly on the rest pin.

See Figure 2-15.

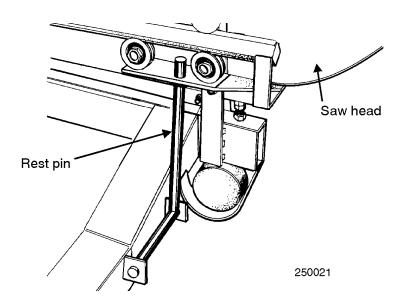

FIG. 2-15

5. Continue lowering the head 3/4" (19mm). until it contacts the stop blocks on the mast rails.

CAUTION! Failure to properly secure the saw head can result in severe machine damage. Lower the saw head onto the rest pin until it contacts the rest pin collar, then lower the saw head 3/4" (19mm) further to insure that the saw head cannot be dislocated from the rest pin.

6. If necessary, adjust the two stops located at the bottom of the mast so the saw head contacts them after it is lowered 3/4" (19mm) past where it contacts the rest pin.

Setup & Operation 2596doc091809 2-27

See Figure 2-16.

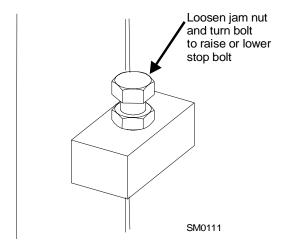

FIG. 2-16

- 7. Engage the clutch/brake lever. This keeps the drive belt tight and the motor from bouncing while traveling. Be sure to disengage the clutch/brake handle after reaching the destination to avoid deformation of the drive belt.
- **8.** Hook the carriage safety chain located at the bottom of the carriage to the bracket at the bottom of the mast.

See Figure 2-17.

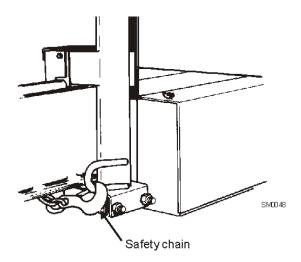

FIG. 2-17

9. Store the loading ramps on the bed rails. Secure to the bed with the two retaining brackets.

2-28 2596doc091809 Setup & Operation

- **10.** Remove all loose objects from the bed of the mill. Store the outrigger jack handle in the bracket provided on the rear/loading-side outrigger guide. Reel in the winch cable. Remove the winch handle.
- **11.** Place both fenders in the slots located behind the trailer tires. Raise all but the very front outrigger.

DANGER! Check to be sure the saw head is resting firmly on the rest pin and mast rail stops and that the safety chain is secured before towing the sawmill.

DANGER! Never tow the sawmill without all guards and covers in place and secured.

Be sure the blade housing and pulley covers are in place and secure. Use the safety retainer pin and cable to fasten blade housing covers.

See the trailer operator's manual for specific information regarding hitch operation and towing the sawmill.

Setup & Operation 2596doc091809 2-29

SECTION 3 MAINTENANCE

This section lists the maintenance procedures that need to be performed.

The Short Interval Maintenance Schedule lists procedures that need to be performed every 4, 8 or 25 hours. The Maintenance Log lists procedures that need to be performed every 50, 100, 200 or 1000 hours. Keep track of machine maintenance by filling in the machine hours and the date you perform each procedure.

This symbol identifies the interval (hours of operation) at which each maintenance pro-• cedure should be performed.

3.1 **Wear Life**

See Table 3-1. This chart lists estimated life expectancy of common replacement parts if proper maintenance and operation procedures are followed. Due to the many variables which exist during sawmill operation, actual part life may vary significantly. This information is provided so that you may plan ahead in ordering replacement parts.

Part Description	Estimated Life
B57 Blade Wheel Belts	400 hours
Blade Guide Rollers	1000 hours
Drive Belt	1250 hours

TABLE 3-1

3.2 Blade Guides

See Figure 3-1.

1. Lubricate the blade guide rollers every four hours of operation. Use one squeeze of a NLGI No. 2 grade lithium grease from a grease gun to lubricate the bearings and remove any sawdust.

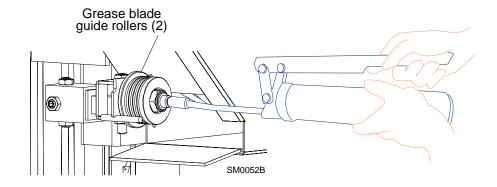

FIG. 3-1

CAUTION! Do not over-grease. Over-greasing will push the seals out of the blade guide bearings.

2. Check the rollers for performance and wear every blade change. Make sure the rollers are clean and spinning freely. If not, rebuild them. Replace any rollers which have worn smooth or have become cone shaped. See The LT25 Parts manual for blade guide rebuild kits and complete roller assemblies.

3.3 Blade Housing

1. Remove the excess sawdust from the blade wheel housings and sawdust chute every blade change.

See Figure 3-2.

2. Make sure the blade screw in the top center of the C-frame is 1/16" (1.5 mm) below the bottom of the blade. If not, loosen the nut and adjust the screw as necessary. Check the screw every 500 hours of operation. Failing to maintain this adjustment will lead to early blade breakage.

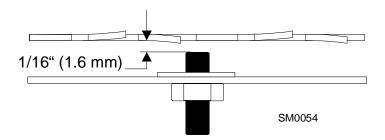

FIG. 3-2

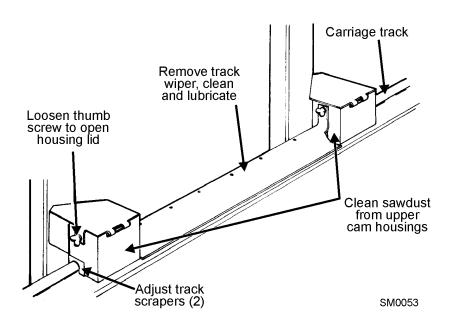

3.4 Carriage Track, Wiper & Scrapers

See Figure 3-3.

- 1. Clean the upper and lower track rails to remove any sawdust and sap buildup every eight hours of operation. Lubricate the lower track rail by wiping it with Dexron III ATF.
- 2. Remove sawdust from the upper cam housings. Loosen the thumb screws on the upper cam housing covers and open. Brush any sawdust buildup from the housings.
- 3. Check the track scrapers as needed. Make sure the scrapers fit firmly against the rail. If a track scraper needs to be adjusted, loosen the thumb screw, push the scraper downward until it fits firmly against the rail, and retighten the thumb screw.
- **4.** Clean and lubricate the upper track wiper every twenty-five hours of operation. Unbolt the wiper, remove it from the sawmill, and remove any sawdust buildup. Soak the felt wiper with Dexron III transmission fluid, 10W30 motor oil or 3-in-1 turbine oil.

CAUTION! Reinstall the wiper so that it lightly touches the track rail. If the wiper presses too firmly against the rail, it can cause the power feed to bind.

3.5 **Vertical Mast Rails**

Clean and lubricate the vertical mast rails every 50 hours of operation. Clean with solvent ⁵⁰ and remove any rust with a light-grade sand paper or emery cloth. Lubricate the mast with motor oil or automatic transmission fluid (ATF).

CAUTION! Never use grease on the mast rails as it will collect sawdust.

3.6 Miscellaneous Lubrication

- 1. Apply a thin film of a NLGI No. 2 grade lithium grease to the blade guide arm every fifty hours of operation to help prevent it from rusting.
- 2. Lubricate the log turner (if equipped) with a NLGI No. 2 grade lithium grease every fifty hours of operation. Lubricate the turner pivot pins with WD-40 or a dry lube.
- **3.** Grease the side supports with a NLGI No. 2 grade lithium grease every fifty hours of operation.
- **4.** Oil all chains with Dexron III ATF every fifty hours of operation.

3.7 Blade Tensioner

- 1. Lubricate the chrome rods of the tensioner system with a heavy duty teflon spray lubricant, such as Gunk L508, every fifty hours of operation.
- 2. Lubricate the tensioner screw handle with a NLGI No. 2 grade lithium grease as needed.

See Figure 3-4.

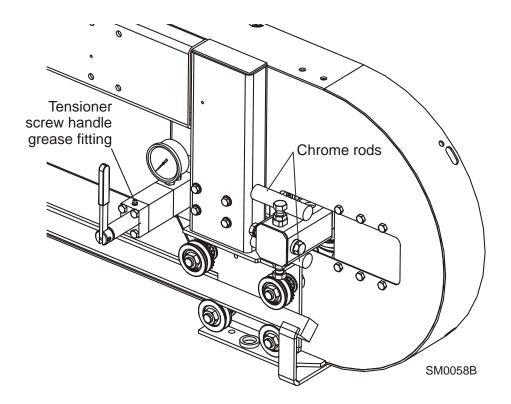

FIG. 3-4

3.8 Blade Wheel Belts

- 1. Rotate the blade wheel belts and check them for wear. Rotating the belts every 50 hours will give you longer belt life. Replace belts as necessary. Use only B57 belts manufactured by Goodyear or Browning.
- 2. Periodically check all belts for wear. Replace any damaged or worn belts as needed.

Brake Strap Adjustment 3.9

Check the brake strap for wear every 200 hours of operation. Replace if damaged or 200 worn.

Also check and adjust the brake strap if the blade does not stop quickly, unusual sounds occur when the brake is applied, or a sudden change is noticed in the clutch handle position when the clutch is disengaged.

To access the brake strap, remove the belt cover located underneath the engine. Engage the clutch/brake lever.

See Figure 3-5. Loosen the two nuts on the lower brake strap clamping plate. Slide the clamping plate and brake strap forward until snug. Retighten the bolts. Replace the belt cover.

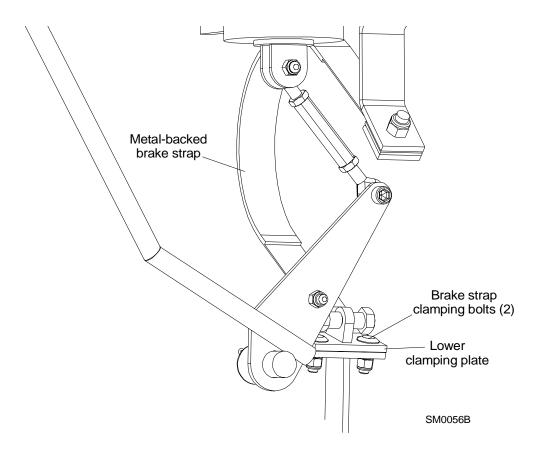

FIG. 3-5

3.10 Drive Bearing

Refill the fluid in the drive-side cylinder bearing housing every 1000 hours of operation. Remove the top and bottom oil plugs. Pour an Automatic Transmission Fluid (ATF) such as Dexron III ATF into the top hole until it begins to flow from the bottom hole. Reinstall the square oil plug to the bottom hole and the vented oil plug to the top hole.

See Figure 3-6.

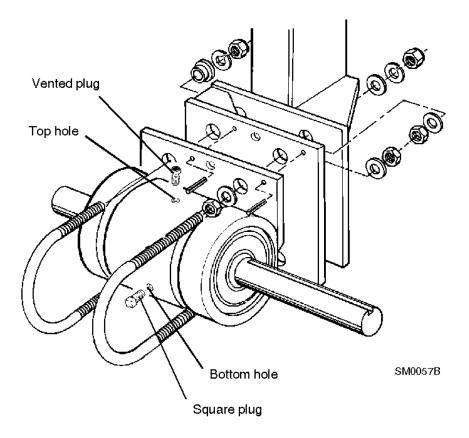

FIG. 3-6

3.11 Up/Down System

Adjust the up/down chain tension as needed. Measure chain tension with the head all the way to the top of the vertical mast. Secure the carriage with a chain at the top. Find the chain adjusting bolt at the bottom of the mast. Loosen the nut on the bolt and move the sprocket down until there is about 1" (2.5 cm) total deflection in the center of the chain with a 5 lb. (2.3 Kg) deflection force.

DANGER! Always secure the cutting head with a 5/16" chain with at least 1900 lbs. working load capacity before adjusting the up/down chain. The cutting head may fall, causing severe injury or death.

See Figure 3-7.

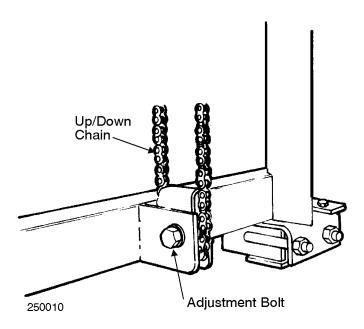

FIG. 3-7

3.12 Feed Rope

Adjust the feed rope as needed. Measure the feed rope tension with the saw head all the way toward the front of the mill. The middle of the rope should have 6-8" deflection. To tighten, pull on the feed rope adjustment handle.

See Figure 3-8.

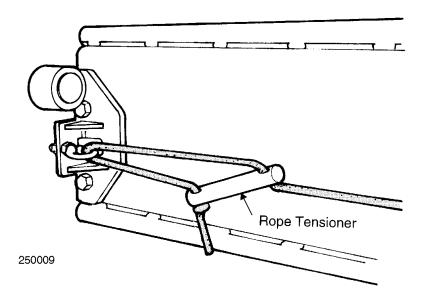

FIG. 3-8

3.13 Miscellaneous Maintenance

- 1. Check the mill alignment every setup. See Section 5, Alignment.
- 2. Make sure all safety warning decals are readable. Remove sawdust and dirt. Replace any damaged or unreadable decals immediately. Order decals from your Customer Service Representative.

WARNING! Keep all safety warning decals clean and visible. If decal becomes worn or damaged, replace immediately.

SECTION 4 TROUBLESHOOTING GUIDE

4.1 Sawing Problems

PROBLEM	CAUSE	SOLUTION	
Blades Dull Quickly	Dirty logs	Clean or debark logs, especially on entry side of the cut	
	When grinding teeth, heating too much and causing teeth to soften	Grind just enough metal to restore sharpness to the teeth. Use water/coolant while sharpening blade	
	Poor sharpening techniques	Make sure the tip is being sharpened completely. <u>See Sharpener Manual.</u>	
Blades Break Prematurely	Rubber belts on blade wheels worn to a point that blade contacts metal pulley - look for shiny spots on edge of wheels	Change blade wheel belts (B-57)	
	Poor sharpening techniques	See Sharpener Manual	
	Tension too tight	Tension blade to recommended specifications	
Blade Does Not Track Right on Drive Wheel	Cant adjustment is incorrect	Readjust	
	Flat/worn belts	Replace B-57 belts	
Blade Guides Do Not Spin While Cutting	Frozen bearings	Replace bearings	
	Stiff bearings	Grease bearings	
Blade Does Not Stop Immediately After Disengaging	Brake strap too loose	Adjust brake strap	
Drive Belts Come Off Pulleys When Disengaging Blade	Brake strap too loose	Adjust brake strap	
	Brake drum misaligned	Realign on drive shaft	
	Brake strap tightened with one edge too loose and one edge too tight	Adjust brake strap	
Drive Belts Wear Prematurely or Jump	Engine/motor and drive pulleys out of alignment	Align pulleys <u>See Section 4.2</u> <u>Engine/Motor and Drive Pulleys</u> <u>Alignment.</u>	

DDOD! 544	04405	
PROBLEM	CAUSE	SOLUTION
Boards Thick Or Thin On Ends Or Middle Of Board	Stress in log which causes log to not lay flat on the bed	After log has been squared, take equal cuts off opposing sides. Take a board off the top. Turn the log 180 degrees. Take a board off. Repeat, keeping the heart in the middle of the cant, and making it your last cut
	Set in teeth	Resharpen and reset blade
	Bed rails misaligned	Realign sawmill.
Height Adjustment Jumps or Stutters When Moving Up or Down	Mast needs lubrication	Lubricate mast track surface
	Up/down chain improperly adjusted	Adjust up/down chain.
	Vertical wear pads are too tight	Adjust pads.
	Drive belt(s) loose	Adjust belts.
Lumber Is Not Square	Vertical side supports not square to bed	Adjust side supports.
	Blade not parallel to bed rails	Adjust bed rails parallel to blade.
	Sawdust or bark between cant and bed rails	Remove particles
	Tooth set problems	Resharpen and reset blade
Sawdust Builds Up On Track	Excessive oiling	Do not oil track
	Track wipers worn	Adjust wipers to firmly contact track
	Track is sticky	Clean track with solvent and apply silicone spray
Wavy Cuts	Excessive feed	Slow feed rate
	Improperly sharpened blade (This will be the problem 99% of the time!)	Resharpen blade. <u>See Sharpener</u> <u>Manual - read entire manual!</u>
	Blade guides improperly adjusted	Adjust blade guides.
	Sap buildup on blade	Use Water Lube.
	Tooth set problem	Resharpen and reset blade

4.2 Engine/Motor and Drive Pulleys Alignment

- 1. Install the drive belt.
- 2. Use a straight edge to align the engine/motor pulley to the drive pulley. Also check that the engine pulley is within 1/8" square with the drive pulley. Loosen the engine mounting bolts and rotate the engine if necessary.
- **3.** Check front-to-back movement of the engine does not exceed 1/4". Tighten the motor mount U-bolts if necessary.
- **4.** Engage the clutch handle and adjust the drive belt tension to 7/16" deflection with 10 lb. of force.
- **5.** Recheck the pulley alignment and engine squareness with the clutch handle engaged. Adjust if necessary.
- **6.** Adjust the drive belt support to 1/4" ($\pm 1/32$) from the belt while engaged.

Troubleshooting Guide 2596doc091809 4-3

SECTION 5 SAWMILL ALIGNMENT

5.1 Pre-Alignment Procedures

The Wood-Mizer sawmill is factory aligned. Periodically check the sawmill alignment and adjust if necessary. This chapter explains how to align the entire sawmill. Care should be taken in performing these steps. Sawmill alignment determines the accuracy and squareness of your cuts.

The sawmill alignment steps are:

- **1.** Ready the sawmill for alignment
- 2. Adjust the lower track rollers
- 3. Adjust the bed rails parallel to the blade
- 4. Adjust the blade guide arm parallel to the bed rails
- 5. Align blade guides to the blade
- 6. Adjust side supports square to the bed
- **7.** Final Adjustments

To insure accurate alignment, the sawmill frame must be level and a blade properly installed.

5.2 Frame Setup

Stationary sawmills should be setup on firm, level ground before proceeding with alignment. Shim the feet so the weight of the sawmill is evenly supported.

Portable sawmills should also be setup on firm, level ground:

LT25: Adjust the two middle outriggers on the main frame tube down just enough to lift weight from the trailer tire.

LT25L: Adjust the two end outriggers on the main frame tube down just enough to lift weight from the trailer tire.

All Portable Sawmills: Adjust the two outer outriggers down just so they touch the ground but do not bear weight.

5.3 Blade Installation And Alignment

See Figure 5-1. Install a blade and apply the appropriate tension. <u>See Section 2.4 Tensioning The Blade.</u> Blade tension is adjusted with the tension handle shown.

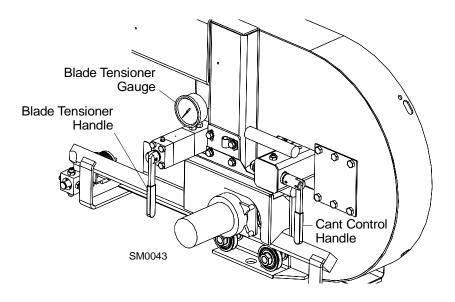

FIG. 5-1

Check the vertical alignment of the blade wheels. The gullet of the blade should ride the same distance from the front edge of the wheel at the top, bottom, and side of the wheel. If it does not, loosen and tighten the appropriate adjustment screws on the back of the wheel. **See Figure 5-1.**

See Figure 5-2. The blade wheels should be adjusted so that the gullet of 1 1/4" blades ride 1/8" (3 mm) out from the front edge of the wheels ($\pm 1/32$ [.75 mm]). The gullet of 1 1/2" blades should ride 3/16" (4.5 mm) from the front edge of the wheels ($\pm 1/32$ [.75 mm]). Do not let the teeth ride on the wheels.

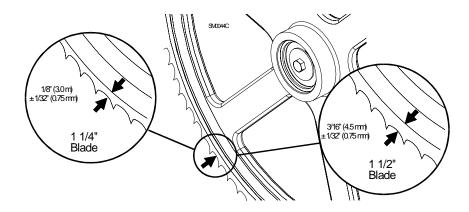

FIG. 5-2

To adjust where the blade travels on the idle-side blade wheel, use the cant control shown in **Figure 5-1.**

 Start the engine. Pull lightly on the clutch handle to rotate the blade until it locates itself on the blade wheels. NOTE: The cant control handle is secured with a spring to prevent it from interfering with the blade guide arm. Remove the handle from behind the spring and return after adjustment is complete.

If the blade is too far forward on the wheels, turn the cant control counterclockwise. If it is too far back on the wheels, turn the cant control clockwise.

2. Some adjustment in blade tension may be needed to compensate for adjustments made with the cant control.

Adjustment with the cant control handle is usually all that is required to track the blade properly on both blade wheels. The drive-side blade wheel will usually not have to be adjusted. If necessary, the drive-side wheel can be adjusted as follows:

Look at the drive shaft from the side. Locate the U-bolt on the right holding the bearing housing to the mounting plates.

Locate the jam nuts on the U-bolt between the two mounting plates. If the blade is running too far to the front of the drive-side blade wheel, turn the jam nuts toward the bearing housing. If the blade is too far back, turn the nuts away from the bearing housing.

Make sure to tighten the jam nuts against the mounting plates when adjustment is complete.

5.4 Saw Head Slide Pad Adjustment

There are eight nylon pads positioned between the saw head frame and vertical mast. The spacing of the pads is factory set and rarely needs adjusting. To check the pad spacing, perform the following steps.

NOTE: The pads on the engine side of the mast are referred to as the "inner" pads. The pads on the control side of the mast are referred to as the "outer" pads.

NOTE: Shims are often used around the clamping bolts, between the C-frame support bracket and the mast v-brace. The shims align the v-brace to the mast so that the entire face of each slide pad makes contact with the mast. Be sure to keep these shims in place when performing the following adjustment.

See Figure 5-3.

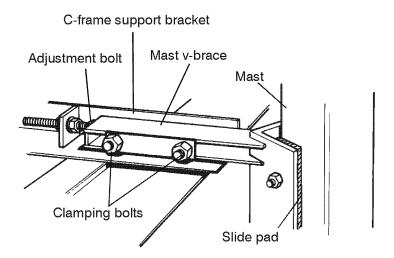

FIG. 5-3

1. Raise the saw head to the top of the vertical mast and secure the saw head with a chain at the top, or shim it underneath. Check the top set of four pads. The outer two pads should be touching the mast rails. There should be a small gap (just wide enough to slide a business card through) between one of the inner pads and the mast rail.

DANGER! Always secure the cutting head with a 5/16" chain with at least 1900 lbs. working load capacity before adjusting the mast pads. The cutting head may fall, causing severe injury or death.

Sawmill Alignment 2596doc091809 5-5

- **2.** To adjust the spacing of the upper set of pads, lower the saw head until you can access the upper slide pad adjustment bolts.
- **3.** Loosen the upper locking bolts and turn the adjusting bolt as necessary to provide the pad spacing described in Step 1.
- **4.** Lower the saw head to the bottom of the vertical mast. Check the bottom set of four pads.

There should be a small gap between one of the outer pads and the mast rail. The gap should be just wide enough to slide a business card through. The inner two pads should be touching the mast rails. To adjust the spacing of the lower set of pads, raise the saw head until you can access the lower slide pad adjustment bolts.

5. Loosen the lower locking bolts and turn the adjusting bolt as necessary to provide the pad spacing described in Step 4.

CAUTION! Due to variations in the vertical mast, the pad spacing may vary throughout the travel of the saw head. Check the pad spacing at the top and bottom ends of the mast only. Pads adjusted too tight will cause premature up/down motor failure.

5.5 Adjusting The Lower Track Rollers

Making these adjustments correctly will give you square cuts and accurate dimensions across the width of your boards.

- 1. Using the feed crank, move the saw carriage so that the blade is positioned over the front pivot end rail.
- 2. Check the lower roller on the bottom track rail. Make sure that the bottom rollers touch the bottom rail but remain loose enough that you can turn them with your finger. Use the vertical bolts to adjust the bottom track rollers.
- 3. Check the inside lower rollers. Both inside rollers should touch the rail so that you cannot spin them by hand. If the rollers are not adjusted evenly and you can spin either one, adjust the horizontal nuts until the roller cannot be spun by hand. Check the other roller and adjust if necessary. Adjust both inside rollers until each evenly supports the carriage and you cannot spin either by hand.
- **4.** Move the carriage forward until the blade is positioned over the rear pivot end rail. Repeat steps 2 & 3 until all lower rollers are adjusted properly at the front and rear of the sawmill.

See Figure 5-4.

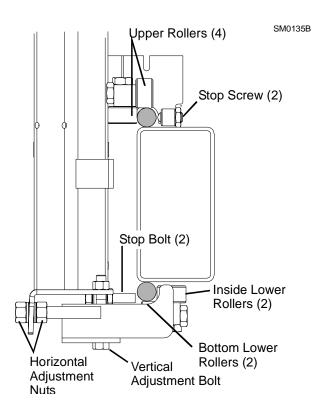

FIG. 5-4

- **5.** Remove the blade guides, or adjust them so that they do not touch the blade.
- **6.** Open the adjustable blade guide arm to within 1/2" (15 mm) of full open.
- 7. Move the carriage back to the front pivot end rail. Raise the cutting head until the bottom of the blade is 17" (400 mm) above the outside of the pivot rail support by actual measurement with a tape or ruler.

See Figure 5-5.

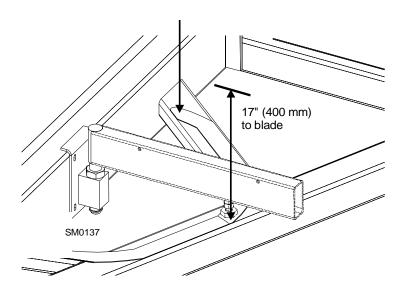

FIG. 5-5

- **8.** Move the carriage forward to check the distance to the blade at the inside of the pivot rail support. All measurements should be equal within 1/32" (0.75 mm).
- **9.** Turn the horizontal adjustment nuts evenly to adjust the inner lower rollers to tilt the saw head until the blade is parallel within 1/32" (0.75 mm) to the pivot rail support.

NOTE: Adjustments of the lower track rollers change the angle between the cutting head and sawmill bed rails. Only small adjustments of the lower track rollers should ever be needed.

10. After the lower track rollers are adjusted properly, adjust the upper stop screws to 1/32" (0.75 mm) from the track rail. Adjust the lower stop bolts to 1/16" (1.58. mm) from the track rail.

CAUTION! It is important that the lower stop bolts are properly adjusted to secure the carriage on the track rail. Failure to properly adjust the stop bolts can cause saw head damage, especially during mill transportation.

5.6 Adjusting Bed Rails To The Blade

1. Install the log clamp at its lowest setting in a hole where the clamp is positioned 10" from the clamp stop (fourth hole from stop).

Move the clamp all the way out to flip the clamp down if neccesary. Adjust the clamp until it is positioned 10" from the clamp stop.

- 2. Move the saw head until the blade is centered over the clamp.
- **3.** Raise the saw head until the blade measures 14 1/2" (360 mm) from the top of the clamp. Use a rule to determine the actual distance of the blade to the clamp.

See Figure 5-6.

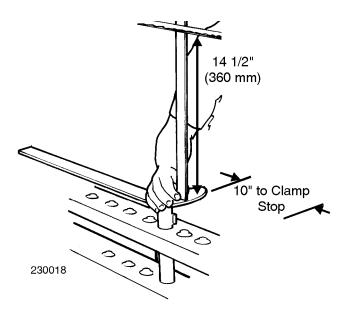

FIG. 5-6

- **4.** Adjust the front pivot rail 90° to the main bed tube.
- **5.** Move the saw head to center the blade over the front pivot bed rail.
- **6.** Measure the distance from the top of the pivot rail to the bottom of the blade. Make this measurement at each end of the pivot rail.
- 7. The two measurements should be 15" (375 mm) (+1/32 [0.75 mm] -0).
- **8.** Loosen the locking set screws and turn the inner height adjustment nut to adjust the height of the inner end of the pivot rail.

See Figure 5-7.

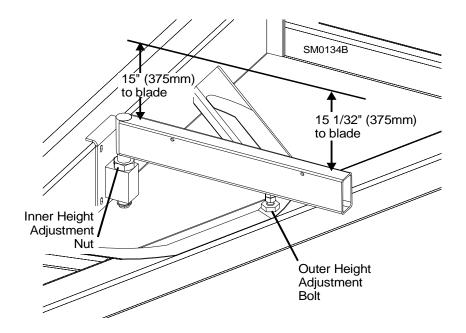

FIG. 5-7

9. Loosen the jam nut and turn the outer adjustment bolt to adjust the height of the outer end of the pivot rail.

CAUTION! Do not roll logs or large cants onto pivot bed rails.

IMPORTANT! Logs and large cants will damage the pivot bed rails or cause misalignment!

- 10. Move the saw head so the blade is positioned over the center of the front main bed rail.
- 11. Measure the distance between the bottom of the blade and the bed rail at each end of the bed rail. The bed rail should measure 15" (375 mm) (+1/32 [0.75 mm] -0) from the blade at both ends of the rail.

See Figure 5-8.

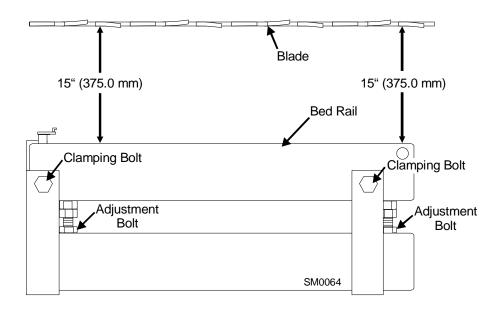

FIG. 5-8

- **12.** Loosen the bed rail clamping bolts and turn the adjustment bolts to move the bed rails to the blade if necessary.
- **13.** Retighen the clamping bolts.
- **14.** Without adjusting the saw head height, check the three remaining main bed rails and the rear pivot rail. Adjust them so that all measure the same distance from the blade at both ends of the bed rail.

5.7 Blade Guide Arm Vertical Adjustment

- 1. Move the saw head so that the blade guide arm is directly over a bed rail.
- 2. Adjust the blade guide arm out to within 1/2" (15 mm) of full open.
- **3.** Put a block of wood between the bed rail and the arm. Lower the carriage so that the arm just rests on the block.

See Figure 5-9.

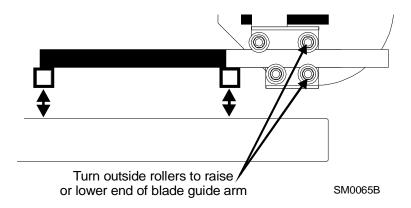

FIG. 5-9

- **4.** Adjust the blade guide arm in to within 1/2" (15 mm) of full closed. Put the block under the arm as before.
- **5.** When the arm is parallel to the bed, it will touch the block in the open and closed position with no adjustment of the saw head height.
- **6.** If the arm is too low in the closed position, loosen the lower outside roller and tighten the upper outside roller (See Step 8.)
- 7. If the arm is too high in the closed position, loosen the upper outside roller and tighten the lower outside roller (See Step 8.)
- 8. The rollers are mounted on cam bolts that raise or lower the arm when turned.

To adjust the rollers, loosen the nut against the blade housing. Locate the cam bolt head inside the housing and turn until the arm is lowered or raised as needed. Recheck the arm in both the open and closed positions. Repeat adjustments until the arm is the same distance from the bed rail in the open and closed position.

9. The blade guide arm should be snug, but not too tight, in the rollers. You should be able to move it in and out with firm hand pressure. There should be no side-to-side play.

5.8 Blade Guide Arm Horizontal Adjustment

- 1. Put the blade guide assembly back in the arm (if you took it out). Put the assembly back so that the flanged collar on the roller is about 1/8" (3.0 mm) from the back of the blade when the throat is 1/2" (15 mm) from full open.
- 2. Close the throat to within 1/2" (15 mm) from fully closed. Check to see that the flange is the same distance from the back of the blade.

See Figure 5-10.

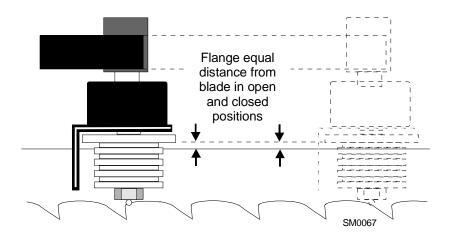

FIG. 5-10

3. If adjustment is needed, the guide rollers can be adjusted in or out on the threaded mounts to open or close the gap.

See Figure 5-11.

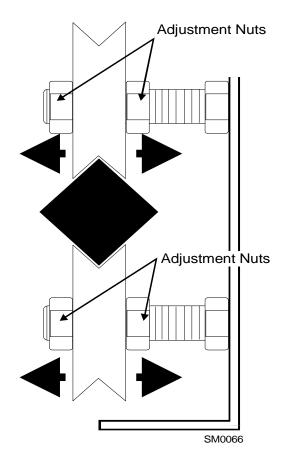

FIG. 5-11

- **4.** Adjusting the inside two rollers (furthest from the arm motor) inward will cause the flange to move toward the blade.
- **5.** Adjusting the two inside rollers outward will cause the flange to move away from the blade.
- **6.** Adjust until the roller flange is the same distance from the back of the blade in the open and closed position.

5.9 Aligning The Blade Guides

Each Wood-Mizer sawmill has two blade guide assemblies that help the blade maintain a straight cut. The two blade guide assemblies are positioned on the saw head to guide the blade on each side of the material being cut.

One blade guide assembly is mounted in a stationary position on the drive side of the saw head. This assembly is referred to as the "inner" blade guide assembly.

The other blade guide assembly is mounted on the idle side of the saw head. It is referred to as the "outer" assembly and is adjustable for various widths of materials to be processed.

Blade guide alignment includes four steps:

- Blade Deflection
- Blade Guide Vertical Tilt
- Blade Guide Flange Spacing
- Blade Guide Horizontal Tilt

Perform the blade guide alignment after you have aligned the blade on the wheels and adjusted the blade and blade guide arm parallel to the bed rails. After blade guide alignment, check the scale indicator to make sure it is adjusted properly (See Section 5.19 Blade Height Scale Adjustment).

5.10 Blade Deflection

Perform the following steps to achieve proper blade deflection with the blade guides.

- 1. Raise the carriage until the blade is 15" (375 mm) above a bed rail. Measure the actual distance with a tape from the top of the rail to the bottom of the blade.
- **2.** Install the blade guides. Make sure the two set screws shown are threaded into the blade guide shaft until they touch each other.

See Figure 5-12.

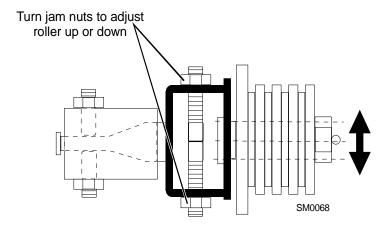

FIG. 5-12

- 3. Loosen the bottom jam nut and tighten the top jam nut until the blade guide deflects the blade down 1/4" (6.5 mm).
- 4. Repeat for the other blade guide.

NOTE: Be sure that the blade guard clears the blade on both guide assemblies. The guard on the outer guide assembly should be checked with the arm all the way in and all the way out.

5.11 Blade Guide Vertical Tilt Adjustment

Check that the blade guide does not tilt the blade up or down. A Blade Guide Alignment Tool (BGAT) is provided to help you measure the vertical tilt of the blade.

- 1. Open the adjustable blade guide arm 1/2" (15 mm) from full open.
- 2. Clamp the alignment tool on the blade. Position the tool close to a blade guide roller. Be sure the tool does not rest on a tooth or burr, and is lying flat on the blade.

See Figure 5-13.

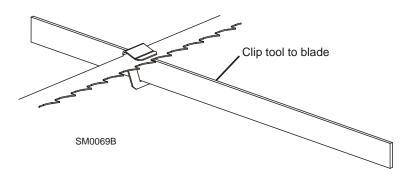

FIG. 5-13

3. Measure the distance from the bed rail to the bottom of the tool.

NOTE: If the sawmill is equipped with stainless steel bed rail covers, be sure to measure from the blade guide alignment tool to the top surface of the cover rather than the bed rail tube.

- **4.** Move the carriage so that the front end of the tool is positioned above the bed rail.
- **5.** Measure the distance from the bed rail to the bottom edge of the tool.
- **6.** Loosen one set screw at the side of the blade guide assembly.
- 7. Use the set screws shown to tilt the blade guide until the measurement from the bed rail to the tool equals the first measurement taken at the center of the tool.

Sawmill Alignment 2596doc091809 5-17

See Figure 5-14.

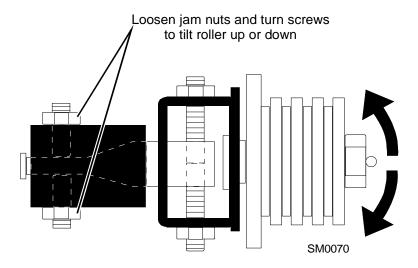

FIG. 5-14

- 8. Move the carriage forward so the back end of the tool is over the bed rail.
- **9.** Use the set screws shown to adjust the blade guide tilt until the measurement from the bed rail to the tool equals the other two measurements taken.
- **10.** Move the tool close to the other blade guide and repeat the previous steps.

NOTE: If major adjustments to blade guide tilt were made, remeasure the distance between the blade and the bed rails to ensure the correct 1/4" (6.5 mm) blade guide deflection. Adjust if necessary.

5.12 Blade Guide Spacing

HINT: When adjusting blade guide spacing, loosen the top set screw and one side set screw only. This will insure horizontal and vertical tilt adjustments are maintained when the set screws are retightened.

- **1.** Adjust the inner blade guide so the blade guide flange is approximately 1/16" (1.5 mm) from the back of the blade.
- **2.** Loosen one side and one top set screw shown. Tap the blade guide forward or backward until properly positioned.

See Figure 5-15.

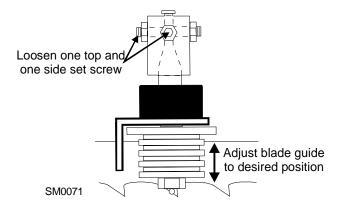

FIG. 5-15

- 3. Retighten the two set screws.
- **4.** Adjust the outer blade guide in the same way so the blade guide flange is approximately 1/8" (3.0 mm) from the back of the blade.

5.13 Horizontal Tilt Adjustment

1. Finally, both blade guides must be tilted horizontally. Adjust the blade guide arm half way in.

See Figure 5-16.

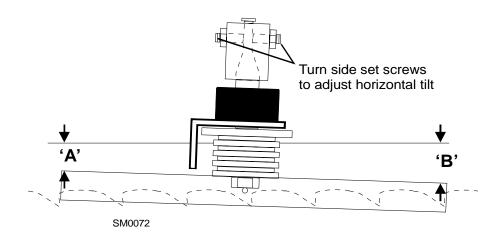

FIG. 5-16

- 2. Place Blade Guide Alignment Tool against the face of the outer blade guide roller.
- **3.** Center the tool on the roller and measure between the back edge of the blade and the ruler at the end closest to the inner blade guide ("B").
- 4. Measure between the back edge of the blade and the other end of the ruler ("A").
- **5.** The roller should be parallel to the blade (A=B) or tilted slightly to the left (A=B-1/4" [6 mm]).
- **6.** Use the side set screws to adjust the horizontal tilt of the roller.
- 7. Repeat Steps 3 7 for the inner blade guide roller.

NOTE: Once the blade guides have been adjusted, any cutting variances are most likely caused by the blade. <u>See Blade Handbook</u>, <u>Form #600</u>.

5.14 Horizontal Adjustment Of Side Supports

The side supports are used to clamp flats on a log to set the squareness of the next cut. The cut will only be as square as the supports.

- 1. Swing the side support down.
- 2. Measure between the face of the support and the main bed tube. Make measurements at both ends of the side support to make sure that it is parallel to the rail.

See Figure 5-17.

- 3. Use the two lower bolts to adjust the side support so B=A or +1/32" (0.8 mm).
- 4. Repeat for remaining side supports.

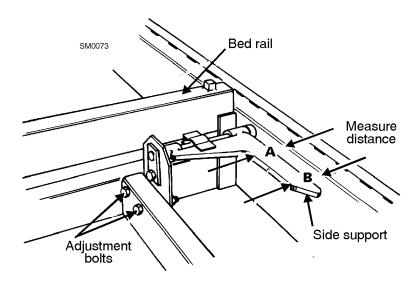

FIG. 5-17

5.15 Vertical Adjustment Of Side Supports

- 1. Place a flat board across the bed rails.
- 2. Swing a side support up so that it is vertical.
- **3.** Pull back at the top of the support to eliminate slack as if a log were being clamped against it.

See Figure 5-18.

- **4.** Check the angle of each support with a square on the board.
- **5.** The side support should be 90° to the bed rails or leaning forward 1/32" (0.8 mm). Loosen the top adjustment bolt, adjust the side support, and retighten the bolt.
- **6.** Repeat for the remaining side supports.

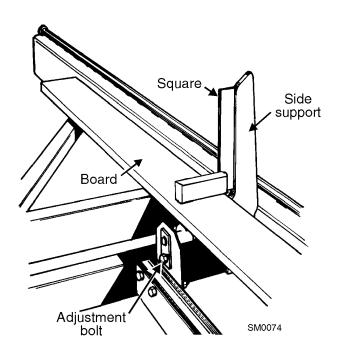

FIG. 5-18

5.16 Clamp Stop Adjustment

- 1. Once the side supports are aligned, pivot them down to their horizontal position.
- 2. Tie a string across the face of the side supports.

See Figure 5-19.

3. Loosen the clamp stop bolts and adjust the clamp stop until it touches the string.

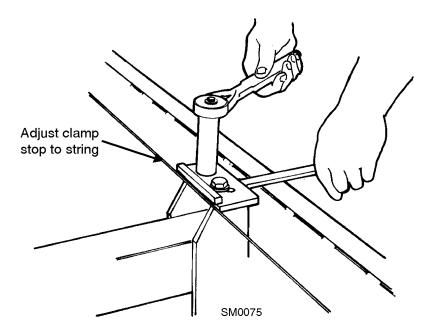

FIG. 5-19

5.17 Sight Gauge Adjustment

NOTE: Sight gauge supplied on LT25 through B7526 only.

After adjustments to the bed rails and blade guides are complete, adjust the sight gauge so that it accurately shows the position of the blade over the bed rails.

- 1. Move the saw head so the sight gauge is positioned over a bed rail.
- 2. Measure from the bed rail to the top of the sight gauge spring.
- **3.** Loosen the nuts securing the sight gauge and adjust until the top of the spring is the same distance from the bed rail as the blade.
- **4.** Retighten the sight gauge nuts.
- **5.** Bend the sight gauge bracket so the spring is parallel to the bed rails.

5.18 Saw Head Tilt

As the blade enters a wide log or cant, the outside of the saw head will drop down slightly. To compensate for the drop, use the lower track roller horizontal bolts to raise the outside of the saw head 1/16" (1.5 mm).

- 1. Move the saw head so the blade is positioned 14 3/4" (375 mm) above a bed rail.
- **2.** Adjust the lower track roller horizontal nuts until the blade measures 14 13/16" (376.5 mm) from the bed rail near the outer blade guide.

See Figure 5-20.

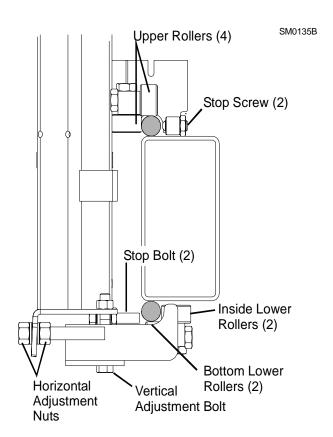

FIG. 5-20

5.19 Blade Height Scale Adjustment

After the entire sawmill has been aligned and all adjustments made, check that the blade height scale indicates the true distance from the blade to the bed rails.

1. Move the saw head so the blade is positioned 14 3/4" (375 mm) above the bed rails by actual measurement with a rule.

See Figure 5-21.

2. View the blade height scale with eyes level with the indicator.

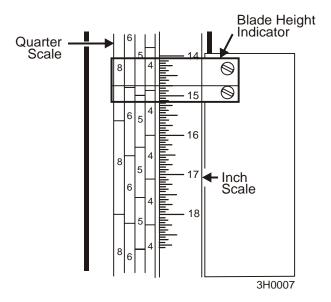

FIG. 5-21

3. Loosen the indicator bracket mounting bolts and adjust the bracket until the indicator is aligned with the 14 3/4" (375 mm) mark on the scale (+0 -1/32 [8 mm]).
